Python Task Tracker

Final session report

AI tools: OpenAI Codex (recorded session model label: gpt-6.1-sol) and a separate ChatGPT conversation for planning, prompt preparation, and draft report answers. The separate conversation's model was not supplied.

Approximate actual time spent: Approximately 20 minutes, as personally reported by the learner.

1. Initial approach and AI assistance

The activity began with a minimal runnable Python starter and separate Git checkpoints. AI first provided setup instructions, then inspected the workspace, created the missing project and GitHub repository, and implemented a simple menu with separate functions. AI also explained the code, updated the README, ran scripted checks, and prepared submission files.

Tasks are held only in a list of dictionaries with description and completed fields. The menu repeats until Exit. No external packages are required by the tracker; there is no database, login, graphical interface, or file saving.

2. One specific AI suggestion and its evaluation

The suggested empty-list guard in get_task_index() prevents completion or deletion from asking for a task number when no tasks exist:

```
if not tasks:
    print("No tasks yet.")
    return None
```

I accept the empty-list guard because it safely prevents selecting a task when none exist. My decision is based on code review and the assistant's reported automated results. I have not supplied manual test results.

3. Testing, results, and remaining problems

The assistant reran eight scripted command-line scenarios on the current project source and the identical submission copy: 16 successful runs. These covered exit; empty-list view/completion/deletion; adding and displaying pending tasks; completion and repeated completion; deletion and renumbering; blank descriptions; invalid menu choices; nonnumeric, decimal, blank, zero, negative, and out-of-range task numbers; and a fresh process starting with no tasks. All assertions passed without errors.

Personal manual testing: The learner explicitly reported that no personal manual test results have been supplied. Earlier placeholder messages are not test evidence.

No program defects were found in the reviewed scope, and no implementation fix was needed. Clearing tasks on exit is the required in-memory behavior. The submission Python file matches the project source byte for byte. PDF creation tools are separate from the program and are not required to run it.

Repository: https://github.com/Sai4158/python-task-tracker (public at the learner's later request). Verified program commit: 5edc51e.
